

# Netusage Manager

## What is Netusage Manager?

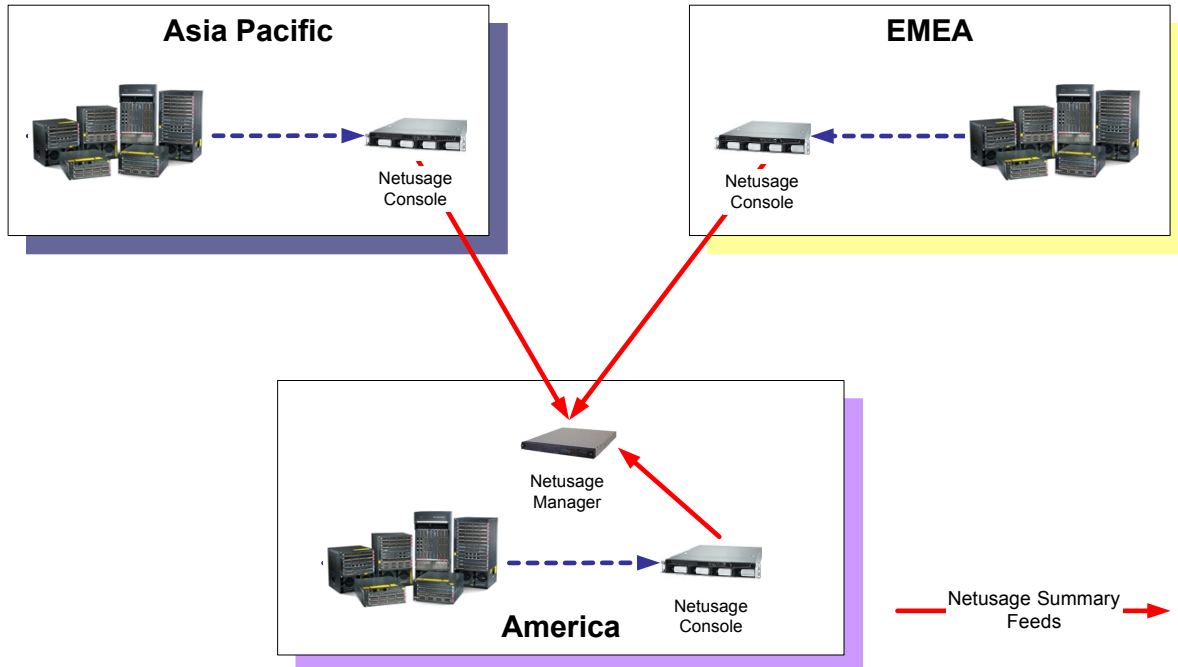

Netusage Manager is a centralised reporting console which allows you gain visibility of your entire network through a single web portal. Netusage Manager seamlessly captures data from two or more distributed Netusage consoles and allows you to view live and historical reports for all links from all Netusage consoles in a single report. If network visibility at a global level matters to you, Netusage Manager is what you need!

## What exactly does it do?

Netusage Manager provides you with live and historical reports on a global basis. The simple-to-use portal allows you to effortlessly drill down into regional Netusage Consoles and view in-depth granular reports. Newly created reports allow you to identify quickly what the current global issues are:

- ▶ Top Hosts Globally – see which users and hosts are creating the most traffic across your organization; who they are talking to and on which links.
- ▶ Top Applications Globally – what are my top applications globally?
- ▶ Global Alarms – what are my alerts across the globe?

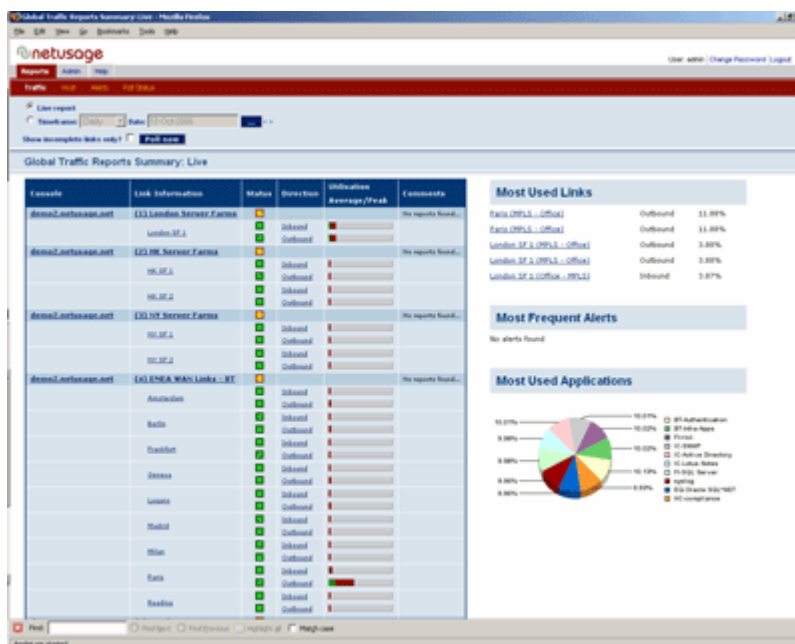

If you have global responsibility for your network, with Netusage Manager you can view all data through one single portal. All regional Netusage consoles send data to Netusage Manager, which provides reports for all links modeled in, say, New York, Singapore, and London, without impacting the performance of the network.

## What are the key benefits?

The single global view is available today:

- ▶ Simple to deploy and easy to administer – Global reports can be up and running in minutes! Netusage Manager has been designed to be simple to deploy and reduce the administrative overhead commonly associated with traditional network management tools. Netusage Manager also includes tools to ensure that it remains easy to configure and use (the intuitive interface means training is unnecessary).
- ▶ Audit and Alert – Netusage Manager allows you to track a particular host across your entire network. This allows you to report on who was talking to whom, using which application, over which links in any given time period. Netusage Manager also provides a single alerting portal (in addition to SNMP alerting to a company's monitoring station). All alerts from individual Netusage consoles can be sent to Netusage Manager to provide drill-down to get detailed visibility of the time period that caused the alert.
- ▶ Speed up the problem-solving process – Netusage Manager provides global visibility of your network, which allows you to quickly locate and identify potential network problems. This reduces the time it takes to identify problems, thus improving your network performance and helping you to exceed end user expectations.
- ▶ Globalisation – With Netusage Manager, true global network visibility is only a few clicks away.

## Netusage Manager at a glance

- Simple to deploy and administer
- Single portal for alerts across the entire networks
- Global usage visibility at your fingertips
- Speed up problem-solving process
